

## icoya OpenContent 2.5

- » icoya OpenContent is the web based all-purpose solution for the creation and maintenance of powerful web site or intranets.

### icoya OpenContent overview

icoya OpenContent allows the easy creation of complex multi-language Internet presences and corporate intranets within a matter of minutes and this without any programming skills. Complicated navigational structures, like links, overviews, or menus are generated automatically. Publishing content with or without time-constrained publishing scenarios is possible as well as offering personalized web pages and secure areas. As icoya OpenContent is completely web-based, the only requirements for working with icoya are a network connection and a web browser, allow being in control of complete Internet presences at anytime and anywhere in the world. The integrated roles and rights managing system and the goal oriented workflow engine provide the necessary tools to easily distribute tasks within teams, optimising the content creation process enormously. Take advantage of this professional content management system at an extremely competitive price.

- ↳ optional: multi-language support

## New features in icoya OpenContent 2.5

### Improved user interface

The user interface of icoya OpenContent was optimized even more in many functional and optical technical details: Every user has his own central workplace, where he can view and manage his icoya-internal bookmarks, references to often-used documents and pending lists. The environment is fully translated and the languages can be switched during on the fly in the multi-language version of icoya OpenContent. Furthermore the internal link- and image choosers were enhanced. All choosers now include a search functionality, which supports the easy integration of links especially with large numbers of documents.

### SymLink technology

The new document type „SymLink“ allows the use of a single and central managed content object in multiple publications in within the project. The simple creation of relations makes it possible to reuse content in multiple places in the portal – this increases the flexibility of the integration of documents and simplifies the content administration.

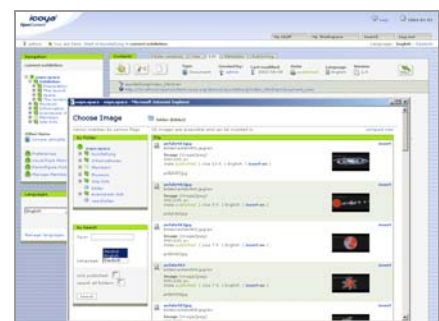

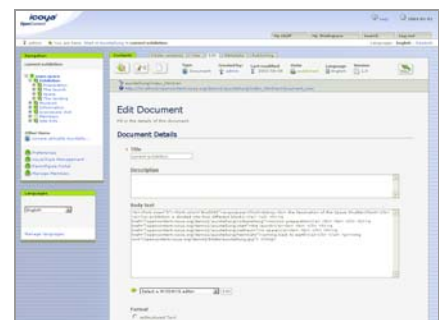

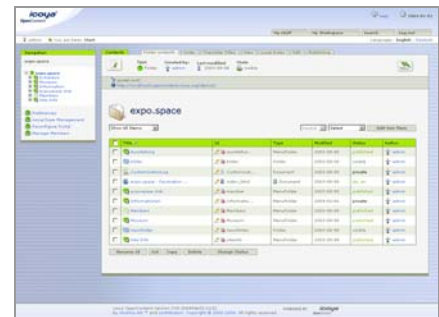

### Shadow functionality

The icoya shadow functionality for documents enables the editing of released and published content in a shadow version, that has to be published again before the modifications are accessible on the website – the original version stays on the website until the shadow version is released again. This allows the editor to work on a new version of the document without modifying the published version that is shown on the website – the editor has full control of the modification and publishing process and ensures the consistency of published content on the website.

- Other new features are
  - ↳ extended template library
  - ↳ new example layout as a basis for own skin development
  - ↳ automatic generation of thumbnails and buttons
  - ↳ image-based navigation structures are generated dynamically
